No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

   SUMMARIES
                      Human small cell 1
Human Sox1 encodin
Mouse Sox1 cDNA.
Chicken Sox1 cDNA.
Degenerate human S
Human small cell 1
Human polynucleoti
Human polynucleoti
  Description
polynucleoti

  The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is a small cell lung cancer associated gene designated as NY-SCLC-2, encoding human SOX1 protein.
  Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded isolated nucleic acid comprising an NA Group 3 or 4 molecule \cdot

   population. The method comprises: (a) detecting Sox1 gene expression in the cells; and (b) isolating those cells expressing Sox1. Also described is a method for producing a cell committed to the neuronal lineage, comprising: (a) transfecting a pluripotent stem cell with a genetic construct encoding Sox1 expression; (b) culturing the stem cells to differentiate into neural cells; and (c) isolating those neural cells produced. The present sequence encodes human Sox1. Detection of Sox1 expressing cells is important in diagnosing and treating cancers of the neurological disorders, especially for repair of accidentally induced trauma in the CNS or for correction of congenital or pathological diseases of the CNS. A patient with a neurological disorder can act as self-donor. Cells may be isolated from the patient and either sorted to extract neuroblasts, or treated in order to differentiate neuroblasts,

XX 
The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can bused in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group I molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head
  Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded isolated nucleic acid comprising an NA Group 3 or 4 molecule -

  The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

  The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. AB199013 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

  The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a ChAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is a small cell lung cancer associated gene designated as NY-SCIC-9, encoding human SOX3 protein.
  Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded isolated nucleic acid comprising an NA Group 3 or 4 molecule -

CC The invention relates to isolated polynucleotide (I) and CC polymerase (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CPCR) primers of the production of (II) and the polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II), (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as CC afood supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations conseponsible for genetic disorders or other traits to assess biodiversity and CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed consectification, but was obtained in electronic format directly from WIPO at figure in the printed process.

  The invention relates to novel isolated lung small cell cancer antigen CC polynucleotides (I) and polypeptides (II) used in a method of detecting CC cancer in a patient. The method is optionally performed by cancer in a patient. The method is optionally performed by cCC utilising oligonucleotides (III), where the biological sample CCC from the patient is contacted with (III), detecting the amount of polynucleotide to (III) in the sample and comparing the CCC amount of polynucleotide to a predetermined cut-off value and thereby CCC determining cancer in a patient. (I), (II) or antigen presenting cells CCC expressing (II) is useful for stimulating and/or expanding T cells SCC expressing (II) is useful for stimulating and/or expanding T cells CCC with one of the components under conditions to permit the stimulation CCC and/or expansion of the cells. A composition comprising (I) is useful for stimulating an immune response in a patient and for inhibiting the CCC development of a cancer especially lung cancer in a patient. An CCC constant of T cell population is useful for removing tumour cells from the CCC constant and for inhibiting the development of cancer in a patient. An As51460-AAS51874 represent novel human lung small cell CCC cancer antigen coding sequences of the invention.

  The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group I molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head the present sequence is a small cell lung cancer associated gene designated as NY-SCLC-1, encoding human SOX2 protein.
            AAK52388 standard; cDNA; 1087 BP
   Claim 57; Page 87; 152pp; English.
   Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded by isolated nucleic acid comprising an NA Group 3 or 4 molecule -

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or

  The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78333-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis activity and may be useful in the diagnossis and/or activin/inhibin activity and may be useful in the diagnossis and/or the content of cancer, leukaemia, nervous system disorders, arthritis and increament of cancer, leukaemia, nervous system disorders, arthritis and
   Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.

   γ
  The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The cused as an indicator when screening for ischaemic condition—improving drugs or therapeutics for ischaemic diseases. AB19913 and AB199914 crepresent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.

   determining cancer in a patient. (I), (II) or antigen-presenting cells expressing (II) is useful for stimulating and/or expanding T cells specific for a tumour protein. The method comprises contacting T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for stimulating an immune response in a patient and for inhibiting the development of a cancer especially lung cancer in a patient. An isolated T cell population is useful for removing tumour cells from the biological sample and for inhibiting the development of cancer in a patient. AAS61860-AAS61874 represent novel human lung small cell cancer antigen coding sequences of the invention.
  The invention relates to novel isolated lung small cell cancer antigen polynucleotides (I) and polypeptides (II) used in a method of detecting cancer in a patient. The method is optionally performed by utilising oligonucleotides (III), where the biological sample from the patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the

  The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is a small cell lung cancer associated gene designated as NY-SCLC-2, encoding human SOX1 protein.
   Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded isolated nucleic acid comprising an NA Group 3 or 4 molecule -

  A method has been developed for isolating neuroblastic cells from a cell population. The method comprises: (a) detecting Sox1 gene expression in the cells; and (b) isolating those cells expressing Sox1. Also described is a method for producing a cell committed to the neuronal lineage, comprising: (a) transfecting a pluripotent stem cell with a genetic construct encoding Sox1 expression; (b) culturing the stem cells to differentiate into neural cells; and (c) isolating those neural cells
  produced. The present sequence represents mouse Sox1 cDNA. Detection of Sox1 expressing cells is important in diagnosing and treating cancers of the nervous system. Neural stem cells are useful for the treatment of neurological disorders, especially for repair of accidentally induced trauma in the CNS or for correction of congenital or pathological diseases of the CNS. A patient with a neurological disorder can act as self-donor. Cells may be isolated from the patient and either sorted to extract neuroblasts, or treated in order to differentiate neuroblasts,
   Sequence 2376 BP; 439 A; 772 C; 745 G; 420 T; 0 other;
  Isolating neuroblastic cells from a population - by detecting the expression of the Soxl gene in the cells and sorting the cells to isolate those cells expressing Soxl

           The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a condition characterised by expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is a small cell lung cancer associated gene designated as NY-SCIC-9, encoding human SOX3 protein.

   CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC constore normal activity of (II) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed constitution, but was obtained in electronic format directly from WIPO CC at fits. Wipo.int/pub/published_pct_sequences.

                  The invention relates to novel isolated lung small cell cancer antigen polynucleotides (I) and polypeptides (II) used in a method of detecting cancer in a patient. The method is optionally performed by utilising oligonucleotides (III), where the biological sample from the patient is contacted with (III), detecting the amount of polynucleotide hybridised to (III) in the sample and comparing the amount of polynucleotide to a predetermined cut-off value and thereby determining cancer in a patient. (I), (II) or antigen-presenting cells expressing (II) is useful for stimulating and/or expanding T cells specific for a tumour protein. The method comprises contacting T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for a stimulation comprises contacting T cells with one of the components under conditions to permit the stimulation and/or expansion of the cells. A composition comprising (I) is useful for the cells.
